Exercise 1

Dr. Körner thinks that students should treat lectures as a dialogue where the student is following the arguments rather than blindly take notes.

- 1. A polygon is a static simple network. The nodes are the vertices and the edges are the sides of the polygon.
- 2. Family trees are dynamic (because relationships can form/change) bipartite (because it's a tree) networks. The nodes are the family members and the edges are the relationships between parents and children.
- 3. Rivers are observable transport networks. The nodes are lakes and oceans, and the edges are rivers.
- 4. Plumbing is a weighted (weighted by pipe thickness) network with directed edges. The nodes are faucets, and the edges are the pipes.

(a)

$$A = \begin{bmatrix} 0 & 1 & 1 & 1 \\ 1 & 0 & 1 & 1 \\ 1 & 1 & 0 & 1 \\ 1 & 1 & 1 & 0 \end{bmatrix}$$

$$L = A - D = = \begin{bmatrix} -3 & 1 & 1 & 1 \\ 1 & -3 & 1 & 1 \\ 1 & 1 & -3 & 1 \\ 1 & 1 & 1 & -3 \end{bmatrix}$$

(b) There would be $\binom{|N|}{2}$ edges.

(c)

$$\det(A - \lambda I) = \det\begin{pmatrix} -\lambda & 1 & 1 & 1\\ 1 & -\lambda & 1 & 1\\ 1 & 1 & -\lambda & 1\\ 1 & 1 & 1 & -\lambda \end{pmatrix}$$
$$= \lambda^4 - 6\lambda^2 - 8\lambda - 3$$
$$= \lambda^4 - 2\lambda^2 + 1 - 4\lambda^2 - 8\lambda - 4$$
$$= (\lambda^2 - 1)^2 - 4(\lambda + 1)^2$$
$$= (\lambda - 1)^2(\lambda + 1)^2 - 4(\lambda + 1)^2$$
$$= (\lambda + 1)^2((\lambda - 1)^2 - 4)$$
$$= (\lambda + 1)^3(\lambda - 3)$$

The eigenvalues of A are $\lambda = -1, 3$. $\lambda = -1$ has algebraic multiplicity of 3.

(d)

$$\det(L - \lambda I) = \det\begin{pmatrix} -3 - \lambda & 1 & 1 & 1\\ 1 & -3 - \lambda & 1 & 1\\ 1 & 1 & -3 - \lambda & 1\\ 1 & 1 & 1 & -3 - \lambda \end{pmatrix}$$
$$= \lambda^4 + 12\lambda^3 + 48\lambda^2 + 64\lambda$$
$$= \lambda^4 + 8\lambda^3 + 16\lambda^2 + 4\lambda^3 + 32\lambda^2 + 64\lambda$$
$$= \lambda^2(\lambda + 4)^2 + 4\lambda(\lambda + 4)^2$$
$$= \lambda(\lambda + 4)^3$$

The eigenvalues of L are $\lambda = -4, 0$.

(a) Adjacency matrix:

$$A = \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}$$

$$A^{2} = \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix}$$

$$A^{3} = \begin{bmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 1 & 1 & 2 \end{bmatrix} \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}$$

$$= \begin{bmatrix} 2 & 3 & 3 \\ 3 & 2 & 3 \\ 3 & 3 & 2 \end{bmatrix}$$

- $A_{11}^3=2$, so there are two paths of length 3 that start and end at node 1.
- (b) The entries of A^3 outside the main diagonal are all 3, so between each pair of different nodes there are 3 paths.

Adjacency matrix:

$$A = \begin{bmatrix} 0 & 1 & 1 & \dots \\ 1 & 0 & 0 & \dots \\ 1 & 0 & 0 & \dots \\ \vdots & \vdots & \vdots & \ddots \end{bmatrix}_{n \times n}$$

$$\begin{split} &\det(A-\lambda I) \\ &= \det\begin{pmatrix} -\lambda & 1 & 1 & \dots \\ 1 & -\lambda & 0 & \dots \\ 1 & 0 & -\lambda & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}_{n\times n} \\ &= -1 \cdot \det\begin{pmatrix} 1 & 1 & 1 & \dots \\ 0 & -\lambda & 0 & \dots \\ 0 & 0 & -\lambda & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}_{(n-1)\times(n-1)} -\lambda \det\begin{pmatrix} -\lambda & 1 & 1 & \dots \\ 1 & -\lambda & 0 & \dots \\ 1 & 0 & -\lambda & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}_{(n-1)\times(n-1)} \end{split}$$

$$\det\begin{pmatrix} 1 & 1 & 1 & \dots \\ 0 & -\lambda & 0 & \dots \\ 0 & 0 & -\lambda & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}_{n \times n}$$

$$= -\lambda \det\begin{pmatrix} 1 & 1 & 1 & \dots \\ 0 & -\lambda & 0 & \dots \\ 0 & 0 & -\lambda & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}_{(n-1)\times(n-1)}$$

$$f(n) = -g(n-1) - \lambda f(n-1)$$

$$g(n) = -\lambda g(n-1)$$

$$g(2) = \det\begin{pmatrix} 1 & 1 \\ 0 & -\lambda \end{pmatrix}$$

$$= -\lambda$$

$$g(n) = (-\lambda)^{n-1}$$

$$f(2) = \det\begin{pmatrix} -\lambda & 1 \\ 1 & -\lambda \end{pmatrix}$$

$$= \lambda^2 - 1$$

$$f(n) = (-\lambda)^n - (n-1)(-\lambda)^{n-2}$$

Verify f(n). Base case:

$$f(2) = (-\lambda)^2 - (2-1)(-\lambda)^0 = \lambda^2 - 1$$

Inductive step:

$$\begin{split} f(n+1) &= -g(n) - \lambda f(n) \\ &= -(-\lambda)^{n-1} - \lambda ((-\lambda)^n - (n-1)(-\lambda)^{n-2}) \\ &= -(-\lambda)^{n-1} + (-\lambda)^{n+1} - (n-1)(-\lambda)^{n-1} \\ &= (-\lambda)^{n+1} - n(-\lambda)^{n-1} \end{split}$$

The characteristic polynomial is $f(n) = (-\lambda)^n - (n-1)(-\lambda)^{n-2} = (-\lambda)^{n-2}((-\lambda)^2 - (n-1))$.

The roots are $\lambda = 0, \lambda = \pm \sqrt{n-1}$.

The largest eigenvalue is $\sqrt{n-1}$.

- (a)
- (b)
